Considering Surgery for Pelvic Prolapse?

Learn about minimally invasive da Vinci Surgery
The Condition: Pelvic Prolapse

Pelvic prolapse is a condition that occurs when muscles and ligaments supporting your pelvic organs weaken. As a result, these organs (uterus, vagina, cervix, bladder, urethra, or rectum) slip from their normal position.

Severe uterine prolapse can cause the uterus to slip partially into the vagina. It may cause the upper part of the vagina to sag into the vaginal canal or even outside the vagina.

Some women with prolapse have no symptoms. Others may experience: a feeling of sitting on a ball, pulling in the pelvis, pelvic or abdominal pain, painful intercourse, protrusion of tissue from the vagina, bladder infections, vaginal bleeding, unusual discharge, constipation or frequent urination.¹

Pelvic prolapse is common, affecting about one in every three women who have had a child.² One in nine women experience symptoms severe enough to need surgery.² Risk factors for prolapse include multiple vaginal deliveries, age, obesity, hysterectomy and smoking.¹
Surgical Options:
Sacrocolpopexy

Your doctor may recommend medication or lifestyle changes to ease your symptoms. If non-surgical treatments do not help or if your symptoms get worse, your doctor may recommend surgery. The procedure is called sacrocolpopexy. During the operation, surgical mesh is used to hold your affected pelvic organ(s) in their natural position. The mesh remains in place permanently. This procedure is not the same as what occurs during transvaginal placement of mesh. Your doctor can fully explain the differences and process to you.

Sacrocolpopexy is considered the most effective way to correct pelvic prolapse and resolve symptoms. It may also be performed following a hysterectomy to provide long-term support of the vagina.

Sacrocolpopexy has traditionally been performed using open surgery. A long, horizontal incision is made in the lower abdomen which allows doctors to reach your pelvic organs.
Laparoscopic surgery is a minimally invasive alternative to open surgery. With laparoscopy, your surgeon operates through a few small incisions using a tiny camera and long, thin surgical instruments. The camera sends images to a video monitor in the operating room to guide surgeons as they operate.

Another minimally invasive surgical option for women diagnosed with pelvic prolapse is da Vinci Surgery.
**da Vinci Surgery:**
A Minimally Invasive Surgical Option

With the *da Vinci System*, your surgeon operates through a few small incisions - similar to traditional laparoscopy. The *da Vinci System* features a magnified 3D HD vision system and tiny wristed instruments that bend and rotate far greater than the human wrist. These features enable surgeons to operate with enhanced vision, precision, dexterity and control - even for complex cases.⁴

As a result of *da Vinci* technology, *da Vinci* Sacrocolpopexy offers the following potential benefits compared to open surgery:

- Less blood loss⁵,⁶
- Shorter hospital stay⁵
- Small incisions for minimal scarring

As a result of *da Vinci* technology, *da Vinci* Sacrocolpopexy offers the following potential benefits compared to traditional laparoscopy:

- Shorter operation⁷
- Less blood loss⁷
- Shorter duration with catheter⁷

Additional potential benefits of *da Vinci* Sacrocolpopexy:

- Low rate of complications⁴,⁸
- High sexual function⁸
- Improved urinary, bowel and pelvic symptoms⁸

**Risks & Considerations Related to Sacrocolpopexy & da Vinci Surgery:**

Potential risks of any sacrocolpopexy procedure include:
- Separation of the vaginal incision
- Blocked lung artery
- Urinary tract injury

In addition to the above risks, there are risks related to minimally invasive surgery, including *da Vinci* Sacrocolpopexy, such as hernia (bulging tissue at incision site).⁷
Important Information for Patients:

All surgery presents risk, including da Vinci Surgery. Results, including cosmetic results, may vary. Serious complications may occur in any surgery, up to and including death. Examples of serious and life-threatening complications, which may require hospitalization, include injury to tissues or organs; bleeding; infection, and internal scarring that can cause long-lasting dysfunction or pain. Temporary pain or nerve injury has been linked to the inverted position often used during abdominal and pelvic surgery. Patients should understand that risks of surgery include potential for human error and potential for equipment failure. Risks specific to minimally invasive surgery may include: a longer operative time; the need to convert the procedure to other surgical techniques; the need for additional or larger incision sites; a longer operation or longer time under anesthesia than your surgeon originally predicts. Converting the procedure to open could mean a longer operative time, long time under anesthesia, and could lead to increased complications. Research suggests that there may be an increased risk of incision-site hernia with single-incision surgery. Patients who bleed easily, have abnormal blood clotting, are pregnant or morbidly obese are typically not candidates for minimally invasive surgery, including da Vinci Surgery. Other surgical approaches are available. Patients should review the risks associated with all surgical approaches. They should talk to their doctors about their surgical experience and to decide if da Vinci is right for them.

For more complete information on surgical risks, safety and indications for use, please refer to http://www.davincisurgery.com/safety.
Your doctor is one of a growing number of surgeons worldwide offering *da Vinci* Surgery.

The Enabling Technology: 
*da Vinci* Surgical System

The *da Vinci* Surgical System is designed to provide surgeons with enhanced capabilities, including high-definition 3D vision and a magnified view. Your doctor controls the *da Vinci* System, which translates his or her hand movements into smaller, more precise movements of tiny instruments inside your body.

Though it is often called a “robot,” *da Vinci* cannot act on its own. Surgery is performed entirely by your doctor. Together, *da Vinci* technology allows your doctor to perform routine and complex procedures through just a few small openings, similar to traditional laparoscopy.

The *da Vinci* System has been used successfully worldwide in approximately 1.5 million various surgical procedures to date. *da Vinci* - changing the experience of surgery for people around the world.
